```
King protein contains the amino acid sequences of human apolipoprotein(a) kringle domains IV36 (LK6 protein), IV37 (LK7 protein) and V38 (LK6 protein), LK68, LK7, LK7 and LK8 are inhibitors are of endothelial cell proliferation, cell migration and normal development of capillaries in the chick embryo chorioallantoic membrane (CAM). LK68 protein, its single kringles or their functional equivalents, are useful for treating anglogenesis-mediated diseases, such as cancer, rheundroid arthritis, psoriasis or coular anglogene disease in animals or humans. LK68 is useful as an anticancer agent and also for inhibiting primary
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     DSGKQPWCYTTDPCVRWEYCNLTQCSETESGVLETPTVVPVPSMEAHSEAAPTEQTPVVR 120

The invention relates to a method of preparing plasminogen kringle 5

peptide fragments. The method comprises mixing mammalian plasminogen and
elastase in the ratio 1.100-1.300, followed by incubating and isolating
the fragment. The kringle 5 peptides are inhibitors of angiogenesis and
endothelial cell proliferation and migration. The peptides are useful
for treating angiogenic diseases, primary and meterstratic solid tumours
and carcinomas of various organs such as breast, genital tract,
endocrine glands, skin, tumours of the brain and eyes and solid tumours
and carcinomas of various organs such as leafwaemias and
lymphomas. They are also used for the prophylaxis of various autoimment
diseases (e.g., rheumatoid arthritis), cular diseases, skin diseases
conforme), diseases caused by excessive or abnormal stimulation of
endothelial cells (e.g., Crohn's disease, atherosclerosis), diseases
conforthelial cells (e.g., Crohn's disease, atherosclerosis), diseases
conforthelial cells (e.g., voultation and establishment of the placenta.
Conforms AbB01906-B01919 represent fragments of human plasminogen used
in an exemplification of the invention.
Note: This sequence is not shown in the specification, but is derived
from the full length human plasminogen sequence (ABB01887) shown in
                                   Plasminogen; human; Kringle domain; endothelial cell proliferation; angiogenesis; antiproliferative; antiatrefroscierrotic; cytostatic; antiprolifematory; antiuloer; antitheumatic; antiatric; antianglogenic; cancer; tuncur; autoimmune disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       119 VRQCYHGNGQSYRGTFSTTVTGRTCQSWSSMTPHRHQRTPENYPNDGLTMNYCRNPDADT 178
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          61 GPWCFTTDPSVRWEYCNIKKCSGTEASVVAPPPVVLLPDVETPSEEDCMFGNGKGYRGKR 120

The invention relates to a method of preparing plasminogen kringle 5

peptide fragments. The method comprises mixing mammalian plasminogen and
elastase in the ratio 1100-1300, followed by incubating and isolating
the fragment. The kringle 5 peptides are inhibitors of anglogenesis and
endothelial cell proliferation and migration. The peptides are useful
for treating anglogenic diseases, primary and metastatic solid tumours
and carcinomas of various organs such as breast, gential tract,
and carcinomas of various organs such as breast, gential tract,
and carcinomas of various organs such as breast, gential tract,
and carcinomas of various organs such as breast gential tract,
and carcinomas. They are also used for the prophylaxis of various autoimmune
lymphomas. They are also used for the prophylaxis of various autoimmune
diseases (e.g., rheumatoid arthritis), coular diseases, skin diseases
(e.g., psoriasis), blood vessel diseases (e.g., heamangiomas, obler Webber
Sydrome), diseases caused by excessive or abnormal stimulation of
endothellal cells (e.g., croin's disease, atherosolerosis), diseases
which have angiogenesis as a pathologic consequence (e.g., cat scratch
agent which inhibits ovulation and establishment of the placenta.

Sydromes Aabolgo6-Bolgig represent framents of human plasminogen used
in an exemplification of the invention.
                                                                                                                                                                                                                         angiogenesis; antiproliferative; antiarteriosclerotic; cytostatic; antiproliferative; antiulcer; antirheumatic; antiarthritic; antiangiogenic; cancer; tumour; autoimmune disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Note: This sequence is not shown in the specification, but is derived from the full length human plasminogen sequence (AAB01887) shown in
                                                                                                                                                                                                         Plasminogen; human; kringle domain; endothelial cell proliferation;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Preparation of Kringle five peptide fragment for treating various disorders such as angiogenic, ocular, skin diseases and cancer, involves mixing mammalian plasminogen and elastase followed by incubation and isolation -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    51.1%; Score 913; DB 21; Length 192; 79.4%; Pred. combinations of anglostatin, andstatuble proteins willow comprise combinations of anglostatin, and platelet factor, thrombospondin, interferon.inducible protein and platelet factor 4, and have anti-anglogenic and/or anti-tumor activity. The multifunctional protein may exhibit useful properties such as having similar or greater biological activity when compared to a single factor or by having improved half-life or decreased adverses side effects, or a combination of these properties. The proteins can be used for treating an anglogenic-mediated disease, e.g. cancer, diabetic retinopathy, macular degeneration, or arthritis. They can also be used for inhibiting the production of tumor cells (characteristic of lung, breast, ovarian, production of tumor cells (characteristic of lung, breast, ovarian, prostate, pancreatic, gastric, colon, renal, bladder cancers; melanoma, growth. The present sequence represents a multifunctional protein of the invention.

The proteins can be used for treating an anniquent-mediated disease, e.g. cancer, diabetic retinopathy, macular degeneration, or arthritis. They can also be used for inhibiting the production of tumor cells (characteristic of lung, breast, ovarian, prostate, pancreatic, gastric, colon, renal, bladder cancers; melanoma, hepatcma, sarcoma and lymbóma) in a patient and for inhibiting tumor growth. The present sequence represents a multifunctional protein of the

The invention relates to new methods and compositions for inhibiting endothelial cell proliferation, using as active component an angiostatin fragment, a combination of angiostatin fragments, or aggregate angiostatin. The fragment is preferably derived from murine, human, Rhesus, porcine or bovine plasminogen and is a kringle 1, kringle 1, kringle 1-3, kringle 1-3, kringle 1-4 or kringle 1-4 bKLS protein. The aggregate angiostatin has a Mol. Wt. of 45-65 kD and is derived from a plasminogen fragment beginning at approximately amino acid number 98 of murine, human, Rhesus, porcine or approximately amino acid number 98 of murine, an beused for treating and openeration and diabetic retinopathy. It can also be used to develop antibodies for use in diagnosis, detection and therapy.

The present sequence, bovine kringle 1-3, is a specific angiostatin fragment which can be used in the invention, and represents amino acids 6-255 of bovine angiostatin.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  WCYTTDPCVRWEYCNLTQCSETESGVLETPTVVPVPSMEAHSEAAPTEQTPVVRQCYHGN 126

AAY02102 standard; Protein; 285 AA.

```
The specification describes multifunctional proteins which comprise combinations of angiostatin, endostatin, interferon, thrombospondin, interferon, interferon, thrombospondin, interferon-inducible protein and platelet factor 4, and have anti-angiogenic and/or anti-tumor activity. The multifunctional protein may exhibit useful properties such as having similar or greater biological activity when compared to a single factor or by having improved half-life or decreased adverse side effects, or a combination of these properties. The proteins can be used for treating an angiogenic-mediated disease, e.g. cancer, diabetic retinopathy, macular degeneration, or arthritis. They can also be used for inhibiting the prostate, pancreatic, gastric, colon, renal, bladder cancers; melanoma, hepatoma, sarcoma and lymphoma) in a patient and for inhibiting tumor growth. The present sequence represents a multifunctional protein of the

```
The specification describes multifunctional proteins which comprise combinations of angiostatin, endostatin, interferon, thrombospondin, interferon.inducible protein and platelet factor 4, and have anti-angiogenic and/or anti-tumor activity. The multifunctional protein properties such as having similar or greater biological activity when compared to a single factor or by having improved half-life or decreased adverse side effects, or a combination of these properties. The proteins can be used for treating an angiogenic and confidence as an engineering and activities. The proteins can be used for treating the production of tumor cells (characteristic of lung, breast, ovarian, prostate, pancreatic, gastric, colon, remal, bladder cancers; melanoma, hepatoma, sarcoma and lymphoma) in a patient and for inhibiting tumor growth. The present sequence represents a multifunctional protein of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        7;

The invention relates to a method of preparing plasminogen kringle 5 peptide fragments. The method comprises mixing mammalian plasminogen and elastase in the ratio 1:100-1:300, followed by incubating and isolating the fragment. The kringle 5 peptides are inhibitors of angiogenesis and endothelial cell proliferation and migration. The peptides are useful for treating angiogenic diseases, primary and metastatic solid tumours and carcinomas of various organs such as breast, genital tract, endocrine glands, skin, tumours of the brain and eyes and solid tumours arising from haematopoietic malignancies such as leukaemias and lymphomas. They are also used for the prophylaxis of various autoimmune diseases (e.g., rheumatoid arthritis), ocular diseases, skin diseases (e.g., rbeumatoid arthritis), ocular diseases, skin diseases (e.g., pood vessel diseases (e.g., haemangiomas, osler-Webber Syndrome), diseases caused by excessive or abnormal stimulation of
                                                                                              angiogenesis; antiproliferative; antiarteriosclerotic; cytostatic; antiproliferative; antiulcer; antirheumatic; antiarthritic; antiangiogenic; cancer; tumour; autoimmune disease.

                                                                                                                                                                                                                                                                                                                              셤
                                                           This sequence represents kringle domains 1-3 of human plasminogen. A 38 harterminal fragment of plasminogen is referred to as angiostatin and inhibits neovascularisation. Angiostatin contains 4 kringle domains of the parent molecule. However, angiostatin containing all 4 kringle domains of the parent molecule. However, angiostatin containing all 4 kringle domains (KI-4) was found to be no more potent as an inhibitor of cell proliferation than an angiostatin only containing KI-3. Therefore, kringle 4 does not posses inhibitory activity. A fragment of the plasminogen coding sequence may be used in the recombinant viral vector of the invention for obtaining angiostatin activity. The vector comprises a promoter capable of expressing human angiostatin operably angiostatin. The vector, which may be a replication defective viral vector, is useful for inhibiting angiogenesis in a mammal, especially

endothelial cells (e.g., Crohn's disease, atherosclerosis), diseases which have angiogenesis as a pathologic consequence (e.g., cat scratch disease and ulcers). The peptides are also useful as a birth control agent which inhibits ovulation and establishment of the placenta. Sequences AAB01906-B01919 represent fragments of human plasminogen used in an exemplification of the invention.

Note: This sequence is not shown in the specification, but is derived from the full length human plasminogen sequence (AAB01887) shown in

The present sequence is deglycosylated kringle 1-5 region protein. Deglycosylated kringle 1-5 region protein has increased antiangiogenic activity as compared to glycosylated kringle 1-5 region protein. The deglycosylated kringle 1-5 region protein was isolated from human plasminogen by affinity chromatography.

Tecovery and purification of Angiostatin protein. Purification of recombinant Angiostatin comprises applying crude fermentation broth containing the Angiostatin comprises applying crude fermentation broth containing the process of protein to an expanded bed cation exchange column, eluting it, and a paplying the elutate to anion exchange column, repeating the process of eluting and applying, to hydroxyapatite column, hydrophobic column and membrane, in order, and collecting fluid passing through the membrane. Angiostatin is useful for treating angiogenesis mediated diseases, including solid tumours, lenkaemia, tumour metastases, benign tumours, Including solid arthritis, psoriasis, ocular angiogenic diseases, Osler-Webber syndrome, myocardial angiogenesis, plaque necovacularisation, telangiectasia, haemophiliac joints, angiofibroma and wound granulation. As a centrifugation technique is not employed in the process, damage to the cells with concemitant release of undesirable biological materials such as cytochromes, pigments, enzymes, chemicals and other undesirable cellular constituents and debris, is prevented. Large scale recovery and purification of proteins is greater than that obtained from prior art methods. Active Angiostatin can be stored in buffers for extended periods of time, in vials or other containers, either in solution which may be Human; plasminogen; angiostatin; greenstatin; thrombolytic factor; angiogenesis inhibitory protein; proliferation; angiogenesis; cancer; Amino acid seguence of human greenstatin protein. Hong Lee JH, Purifying angiogenesis inhibitors produced as recombinant proteins in Escherichia coli, useful as anticancer agents and for treating ocular

The present sequence represents the human greenstatin protein. It is derived from the plasminogen protien, and comprises amino acids 101-354. Angiostatin is also derived from plasminogen, and comprises amino acids 99-467. Angiostatin and greenstatin are used as amino acids 99-467. Angiostatin and greenstatin are used as thrombolytic factors and angiogenesis inhibitory proteins. Angiostatin contains the kringle 1-4 region of plasminogen, and greenstatin contains the kringle 1-3 region of plasminogen. As both proteins contains the kringle i-3 region of plasminogen. As both proteins contain a high specification describes a method for the purification of such angiogenesis inhibitory proteins. The method comprises solubilising the proteins, produced as inclusion bodies in Eschericina coll and refolding the solubilised fraction in buffer containing urea and glutathione. The angiogenesis inhibitory proteins specifically inhibit proliferation of vascular endothelial cells, but not that of non-endothelial cancers or normal cells. The angiogenesis inhibitory proteins are used to suppress angiogenesis, specifically for treating cancers (e.g. of lung, skin and brain) or ophthalmic diseases (e.g. glaucoma and diabetic retinopathy), but also arthritis and psoriasis.

The invention relates to new methods and compositions for inhibiting endothelial cell proliferation, using as active component an angiostatin fragment, a combination of anglostatin fragment, or combination of anglostatin fragments, or aggregate angiostatin The fragment is preferably derived from murine, name, thesus, porcine or bovine plasminogen and is a kringle 1.6 kringle 2, kringle 3, kringle 2.3 kringle 1.3 kringle 1.2 kringle 1.4 or kringle 1.4 kringle 1.4 kringle 1.4 kringle 1.4 kringle 1.5 kringle 1.5 kringle 1.5 kringle 1.5 kringle 1.5 kringle 1.5 kringle 1.6 for 5 kD and is derived from a plasminogen fragment beginning at approximately amino acid number 98 of murine, human, Rhesus, porcine or bovine plasminogen. The active component can be used for treating and suglogenesis-madiated dispasses such as cancer, arthritis, macular degeneration and diabetic retinopathy. It can also be used to develop antibodies for use in diagnosis, detection and therapy.

C The present sequence, Rhesus kringle 1.3, is a specific angiostatin fragment which can be used in the invention, and represents amino caids 6-255 of Rhesus angiostatin.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  angiostatin; plasminogen; kringle; angiogenesis; cancer; arthritis; macular degeneration; diabetic retinopathy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Use of angiostatin fragments or aggregates - for inhibiting endothelial cell proliferation and treating angiogenesis-mediated diseases, e.g. cancer, arthritis or diabetic retinopathy
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Query Match 39.4%; Score 704; DB 17; Length 250; Best Local Similarity 42.5%; Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Sequence 32,

Sequence 33, Application US/09761120

Sequence 33, Application US/09761120

Patent No. US20020037847A1

GENERAL INFORMATION:

APPLICANT: FOLKman, M. Judah

APPLICANT: POLKman, M. Judah

APPLICANT: POLKMAN, Nachael

TITLE OF INVENTION: Nachael

CURRENT PELICATION NUMBER: US/09/761,120

CURRENT APPLICATION NUMBER: 09/309,821

PRIOR FILING DATE: 1999-05-11

PRIOR FILING DATE: 1999-05-11

PRIOR FILING DATE: 1999-05-30

NUMBER OF SEQ ID NOS: 47

SOFTWARE: PATENTIN VERSION 3.0

SOFTWARE: PATENTIN VERSION 3.0

LENGTH: 250
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           7;

Sequence 11. Application US/09761120
Patent No. US20020037847A1
GENERAL INFORMATION:
GENERAL INFORMATION:
APPLICANT: FOLKman W. Judah
APPLICANT: O'REALLY, Michael
TITLE OF INVENTION: Nucleic Acids Encoding Kringle 1-5 Region Fragments of Plasmin
TITLE OF INVENTION: Nucleic Acids Encoding Kringle 1-5 Region Fragments of Plasmin
CURRENT APPLICATION NUMBER: 095040-011 (43171-252068)
CURRENT APPLICATION NUMBER: 09709/761,120
CURRENT FILING DATE: 1999-05-11
PRIOR FILING DATE: 1999-05-13
PRIOR APPLICATION NUMBER: 08/866,735
PRIOR FILING DATE: 1997-05-30

May constitute a glutathionine peroxidase-like protective system against peroxide damage in sperm membrane lipids.
-!- CATALYTIC ACTIVITY: 2 glutathione + H(2)0(2) = oxidized glutathione + E(2)0.
-!- SUBCELLULAR LOCATION: Secreted.
-!- SINCELLULAR LOCATION: Secreted.
-!- TISSUE SPECIFICITY: EPIDIDIMIS.

May constitute a glutathionine peroxidase-like protective system against peroxide damage in sperm membrane lipids.
-: CAPALYTIC ACTIVITY: 2 glutathione + H(2)O(2) = oxidized glutathione + D H(2)O.
-: SUBCELLUAR LOCATION: Secreted.
-: SUBCELLUAR: LOCATION: Secreted.
-: TISSUE SPECIFICITY: EPIDIDIMIS.
-: SIMILARITY: Belongs to the glutathione peroxidase family.
                                                                                                                                                                                                                                                                                                                                 183 F------TIDPSIRWEYCNLTRCSDTEGTVVAPPTVIQVPSLGPPSE

J. 285:863-870(1992).

-1- FUNCTION: Protects cells and enzymes from oxidative damage, by catalyzing the reduction of hydrogen peroxide, lipid peroxides and organic hydroperoxide, by glutathione. May constitute a glutathionine peroxidase-like protective system against peroxide damage in sperm membrane lipids.

-1- CATALYTIC ACTIVITY: 2 glutathione + H(2)O(2) = oxidized glutathione + 2 H(2)O(2) = oxidized glutathione + 2 H(2)O(2) = oxidized glutathione + 2 H(2)O(2) = oxidized glutathione PERORIGITY: SPIDIDYMIS.
-1- SIMILARITY: Belongs to the glutathione peroxidase family.
                                                                                                                                                                                                                         Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           01-DEC-1992 (Rel. 24, Created)
